

Reinforced Soil Wall Systems

“Examples of permanent and temporary reinforced soil embankments, using Verdatex G polyester geogrids and Verdatex polyester geotextiles, in the “wraparound” system. The length of geogrid/geotextile, installed in the embankment is designed and lift heights are generally 500mm. Both granular and cohesive fills may be used and compacted to highway standards. A topsoil block is placed and hand compacted in the front face of permanent embankments, in order to provide fully vegetated slopes.”
